Branch: REC

Department: I AI & DS AF

Batch: 2028

Degree: B.E - AI & DS

### NeoColab\_REC\_CS23231\_DATA STRUCTURES

REC\_DS using C\_Week 1\_COD\_Question 3

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

#### 1. Problem Statement

Imagine you are working on a text processing tool and need to implement a feature that allows users to insert characters at a specific position.

Implement a program that takes user inputs to create a singly linked list of characters and inserts a new character after a given index in the list.

## **Input Format**

The first line of input consists of an integer N, representing the number of characters in the linked list.

The second line consists of a sequence of N characters, representing the linked list.

The third line consists of an integer index, representing the index(0-based) after

which the new character node needs to be inserted.

The fourth line consists of a character value representing the character to be inserted after the given index.

#### **Output Format**

If the provided index is out of bounds (larger than the list size):

- 1. The first line of output prints "Invalid index".
- 2. The second line prints "Updated list: " followed by the unchanged linked list values.

Otherwise, the output prints "Updated list: " followed by the updated linked list after inserting the new character after the given index.

Refer to the sample output for formatting specifications.

### Sample Test Case

Input: 5

```
a b c d e

2

X

Output: Updated list: a b c X d e

Answer

#include<stdio.h>
#include<stdlib.h>
typedef struct Char{
    char value;
    struct Char* next;
}Node;
Node*newnode(char value) {
    Node* new_node = (Node*)malloc(sizeof(Node));
    new_node->value = value;
    new_node->next = NULL;
    return new_node;
}
```

```
241801314
    void insertNode(Node**head, char value){
   Node* temp = *head;
      if(temp == NULL) {
         *head = newnode(value);
         return;
      }
      while(temp->next != NULL) {
         temp = temp->next;
      temp->next = newnode(value);
    int length(Node* head) {
      int len = 0;
      while(head != NULL) {
       head =head->next;
         len++;
      return len;
    void traverse(Node* head){
      while(head != NULL) {
         printf("%c ",head->value);
         head = head->next:
      }
      printf("\n");
                                                     241801314
if(pos >= length(*head)) {
    printf("Invalid indox')
    void insert(Node**head, int pos, char value) {
         return;
      Node* temp = *head;
      for(int i=0;i<pos;i++) {
         temp = temp->next;
      Node* new_node = newnode(value);
      new_node->next = temp->next;
      temp->next = new_node;
                          241801314
                                                     241801314
    int main()
      int n;
